

Trader Performance vs Bitcoin Market Sentiment

Institutional-style research deck on Hyperliquid fills, realized PnL, sizing behavior, and Fear/Greed regimes.

RESEARCH DATE

8 Jun 2026

DATA WINDOW

2023-05-01 to 2025-05-01

SAMPLE

211,218 matched fills

Sentiment is not the alpha; regime discipline is

The dataset shows profitable trading across all regimes, but quality of PnL changes materially when viewed through sizing, win-rate, and PnL-per-dollar lenses.

MATCHED FILLS

211,218

TOTAL CLOSED PNL

\$10.3M

WIN RATE

41.1%

VOLUME

\$1.2B

ACCOUNTS

32

- Extreme Greed produced the strongest risk-normalized outcome; Extreme Fear had the weakest PnL per dollar even though it was still positive.
- Fear generated the largest absolute PnL pool, meaning total PnL is partly a volume allocation story, not only a signal-quality story.
- Daily sentiment-value correlation with average PnL is close to flat; the practical edge is conditional trade selection and sizing, not blind sentiment following.
- The trading-company playbook is to convert sentiment into risk budget rules: scale, side bias, and account review thresholds by regime.

A clean fill-level join, then regime-level trader diagnostics

The analysis treats sentiment as a daily market state and evaluates realized trader behavior inside that state.

1

Normalize data

Parse IST timestamps, map to calendar date, clean numeric fields, and preserve fill-level records.

2

Join market state

Attach Fear/Greed classification and numeric sentiment value to every matched fill date.

3

Measure performance

Evaluate total PnL, average PnL, win rate, fee drag, profit factor, and PnL per \$1K traded.

4

Diagnose behavior

Cut results by side, direction, account, symbol, and daily trend to separate alpha from exposure.

Data integrity note: 211,218 of 211,224 fills matched to a sentiment date; 6 unmatched fills were excluded from sentiment cuts.

Absolute PnL and capital efficiency do not tell the same story

A trading desk should read total PnL beside PnL per \$1K, win rate, and profit factor before changing risk limits.

Regime	Fills	Total PnL	Win Rate	PnL / \$1K	Profit Factor
Extreme Fear	21,400	\$739.1K	37.1%	\$4	2.16x
Fear	61,837	\$3.4M	42.1%	\$15	6.66x
Neutral	37,686	\$1.3M	39.7%	\$10	4.32x
Greed	50,303	\$2.2M	38.5%	\$20	3.03x
Extreme Greed	39,992	\$2.7M	46.5%	\$40	11.02x

Capital efficiency: avg PnL per \$1K traded

Side-level performance shows where regime exposure really sits

The strongest desk use-case is not asking whether Fear or Greed is good; it is asking which behavior is rewarded under each state.

Side-level PnL by sentiment regime

	BUY	SELL
Extreme Fear	\$373K	\$366K
Fear	\$2M	\$1M
Neutral	\$554K	\$739K
Greed	\$614K	\$2M
Extreme Greed	\$188K	\$3M

Desk interpretation

Side and direction cuts expose whether PnL is coming from deliberate regime adaptation or simply from more trading activity.

If a side dominates PnL in a regime, the next test should be drawdown, slippage, and fee-adjusted return by that side.

Use this as a risk-routing layer: trade authorization, position size, and review cadence should differ by sentiment state.

Sentiment co-moves with activity more than it directly explains PnL

The daily view keeps the analysis honest: regime labels are useful context, but PnL remains trader- and execution-dependent.

Daily sentiment value vs average realized PnL

Daily metric	Corr. vs sentiment
Avg PnL	0.04
Total PnL	-0.08
Win rate	0.15
Volume	-0.26
Fill count	-0.25

Read: a low raw correlation does not invalidate sentiment. It means sentiment is better used as a conditional risk-management variable than as a standalone directional predictor.

A small set of accounts explains much of the realized edge

Trading-company review should separate regime quality from trader skill concentration.

Top account contribution to realized PnL

Account	Fills	Total PnL	PnL / Fill
0xb1231a4a2d...	14,733	\$2.1M	\$145
0x083384f897...	3,818	\$1.6M	\$419
0xbaaaf6571a...	21,192	\$940.2K	\$44
0x513b8629fe...	12,236	\$840.4K	\$69
0xbee1707d6b...	40,184	\$836.1K	\$21
0x4acb90e786...	4,356	\$677.7K	\$156
0x72743ae282...	1,590	\$429.4K	\$270
0x430f09841d...	1,237	\$416.5K	\$337

Action: benchmark top accounts by regime-specific process, not just outcome. The repeatable learning is how they size and close positions when sentiment is crowded.

Profits cluster by market; symbol mix can mask sentiment conclusions

A regime may look strong because the traded symbols in that regime were favorable, not because sentiment alone created edge.

Top symbols by realized PnL

Symbol	Fills	Volume	Total PnL	PnL / \$1K
@107	29,992	\$55.8M	\$2.8M	\$64
HYPE	68,005	\$142.0M	\$1.9M	\$11
SOL	10,691	\$125.1M	\$1.6M	\$15
ETH	11,158	\$118.3M	\$1.3M	\$9
BTC	26,064	\$644.2M	\$868.0K	\$1
MELANIA	4,428	\$7.0M	\$390.4K	\$65
SUI	1,979	\$7.8M	\$199.3K	\$21
DOGE	826	\$2.5M	\$147.5K	\$26

High-volume and loss days should become risk-rule exceptions

The institutional move is to translate outlier days into pre-trade controls and post-trade review triggers.

Best PnL days

Date	Classification	Total Pnl	Volume Usd	Win Rate
2025-03-03	Fear	\$616.4K	\$8.2M	61.5%
2024-12-12	Extreme Greed	\$599.2K	\$4.6M	70.0%
2025-02-04	Greed	\$416.9K	\$15.7M	27.7%
2025-04-12	Fear	\$410.4K	\$55.9M	27.2%
2024-12-22	Greed	\$352.2K	\$3.1M	43.5%

Worst PnL days

Date	Classification	Total Pnl	Volume Usd	Win Rate
2025-04-23	Greed	-\$419.0K	\$30.7M	32.5%
2024-11-28	Extreme Greed	-\$127.1K	\$1.9M	32.8%
2024-08-04	Fear	-\$122.7K	\$1.2M	2.4%
2024-12-06	Greed	-\$92.6K	\$3.5M	23.3%
2025-03-11	Extreme Fear	-\$76.9K	\$14.0M	18.7%

Highest-volume days

Date	Classification	Volume Usd	Total Pnl	Win Rate
2025-04-12	Fear	\$55.9M	\$410.4K	27.2%
2025-04-21	Fear	\$42.1M	\$34.4K	39.4%
2025-04-16	Fear	\$36.5M	\$58.6K	34.0%
2025-04-24	Greed	\$35.1M	\$50.7K	41.4%
2025-04-29	Greed	\$34.1M	\$125.7K	43.2%

Convert sentiment into a risk budget, not a buy/sell button

A practical trading-company framework uses sentiment to change position sizing, review intensity, and execution standards.

Regime	Desk posture	Trading rule	Why
Extreme Fear	Defense first	Reduce impulse entries; require liquidity check; favor smaller clips	High uncertainty / adverse-selection risk
Fear	Selective offense	Allow risk where account/symbol edge is proven; monitor fee drag	Largest PnL pool but volume-driven
Neutral	Baseline	Use standard limits; no sentiment-based override	Control state
Greed	Momentum with guardrails	Permit trend exposure; tighten loss review and take-profit discipline	Crowding risk rising
Extreme Greed	High-quality offense	Scale only for accounts with proven efficiency; avoid late crowded trades	Best PnL per \$1K in this dataset

Recommended next test: backtest these regime-specific rules using fee-adjusted PnL, adverse excursion, and drawdown by account.

External context used to shape the trading-company narrative

These references were used for methodology framing and industry-style interpretation; the empirical results come from the supplied CSV files.

Sentiment index construction	Alternative.me frames the Crypto Fear & Greed Index as a Bitcoin-market sentiment gauge built from inputs such as volatility, market momentum/volume, social media, dominance, and trends.
24/7 risk-management lens	CME's 2026 crypto paper emphasizes continuous price discovery and risk management because crypto volatility persists outside traditional market hours.
Fill-level data interpretation	QuickNode's Hyperliquid trade dataset documentation defines executed fills and fields including side, direction, closedPnl, fees, trade IDs, and timestamps.
Regime extremity caution	Recent quantitative research on Fear & Greed regimes argues that sentiment extremes can proxy uncertainty and liquidity stress, so extremes need risk controls.
